1. AGENCY USE ONLY (Leave blank)	2. REPORT DATE 12 Aug 02	3. REPORT TYPE AND DATES COVERED FINAL REPORT 01 MAR 01 - 28 FEB 02
4. TITLE AND SUBTITLE AN OPTICAL PARAMETRIC OSCILLATOR FOR ORGANIC PHOTONIC MATERIALS		5. FUNDING NUMBERS F49620-01-1-0217  3484/US  61103D
6. AUTHOR(S) Prof. Bernard Kippelen		
7. PERFORMING ORGANIZATION NAME(S) AND ADDRESS(ES) University of Arizona Optical Science Center 1630 E. University Blvd. Tucson, AZ 85721		8. PERFORMING ORGANIZATION REPORT NUMBER
9. SPONSORING/MONITORING AGENCY NAME(S) AND ADDRESS(ES) AFOSR/NL 4015 Wilson Blvd. Room 713 Arlington, VA 22203-1954		10. SPONSORING/MONITORING AGENCY REPORT NUMBER
11. SUPPLEMENTARY NOTES		
12a. DISTRIBUTION AVAILABILITY STATEMENT Approve for Public Release: Distribution Unlimited		12b. DISTRIBUTION CODE
13. ABSTRACT (Maximum 200 words) This report is to certify that we have acquired a Spectra Physics femtosecond Optical Parametric Oscillator OPAL - 1.5 that delivers pulses at a wavelength that is tunable from 1.35 to 1.6 um, for the amount of \$65,000. The OPAL was installed in November 2001 and has been running properly since then. This acquisition provided us with the femtosecond laser source needed to conduct research on organic photonic materials for telecommunications and displays.

This report is to certify that we have acquired a Spectra Physics femtosecond Optical Parametric Oscillator OPAL - 1.5 that delivers pulses at a wavelength that is tunable from 1.35 to 1.6  $\mu\text{m}$ , for the amount of \$65,000. The OPAL was installed in November of 2001 and has been running properly since then. This acquisition provided us with the femtosecond laser source needed to conduct research on organic photonic materials for telecommunications and displays.

The laser system is used to establish the foundations for an understanding of charge injection, charge transport, charge trapping, and light-emission in organic molecules and polymers and their applications in storage, displays, and imaging. We are currently developing photorefractive polymers with non-destructive read-out. In these materials, photoconduction is initiated by exciting the organic composites via two-photon states. Photon-gated photorefractive polymers with non-destructive read-out properties are used for image filtering using holographic time gating techniques. The laser system will also be used to investigate the optical gain properties in light-emitting organic molecule and polymers in order to advance the development of organic lasers. The study and characterization of the electronic levels participating in the light-emission process will be conducted through femtosecond pump-probe experiments combined with ultrafast photoconductivity experiments.
